IMPORTANT: CABLE ROUTING ON PIVOT MACH 6

We have noticed that our Mach 6 demo bike has suffered a small amount of cable rub on the seat tube and rear stays around the upper linkage.

We strongly recommend modifying the cable routing using a small zip tie and 4mm gear ferrule on both sides of the yoke to effectively lift the cables clear of other surfaces. The cables should also be crossed over the top of the rear shock forming an ‘X’.

We also advise applying Effetto Mariposa Shelter Tape to wear-critical areas on the frame for maximum protection. This is best done during the initial assembly of the bike.
